

WHY BIOGAS?

- More efficient waste management (recycling of organic waste).
- Cheaper and greener energy (heating, electricity, transportation).
- Improved climate and environment (sustainable society, better world).

Household

City Councils, Municipalities, utility companies and authorities in general must respond to several demographic challenges as the urban population increases, causing major environmental waste problems.

Better infrastructure is required, especially when it comes to waste management, recollection and recycling.

The population demands action for a better quality of life.

The Combigas concept can help you achieve:

- effective and efficient waste management,
- an improved environment and climate,
- a better world,
- integration and optimization in relation to environment, population as well as political and cultural diversity.

Organic waste from households, restaurants, and the like, is a huge resource for biogas production.
